### 4.1 Other site characteristics

#### Soil & geology:

Acidic, Basic, Clay, Neutral, Peat, Sandstone, Sedimentary

#### Geomorphology & landscape:

Lowland, Slope, Upland, Valley

### 4.2 Quality and importance

*Drepanocladus (Hamatocaulis) vernicosus*

- for which this is considered to be one of the best areas in the United Kingdom.

### 4.3 Vulnerability

All areas of the site supporting *Drepanocladus vernicosus* form part of the Ministry of Defence army training area. These were formerly mostly used by artillery. The ranges now offer important infantry training. No areas with *D. vernicosus* lie in areas affected by the impact of large munitions but may suffer sporadic damage from trampling and the use of small explosive charges. All areas with *D. vernicosus* are grazed by sheep, currently at levels sufficient to prevent scrub encroachment, whilst not damaging the flush vegetation. In the recent past, the MoD undertook some drainage of flushes by the use of open ditches, but none of these areas were affected.

Plans to change the grazing/letting arrangements from an annual licence held in common over the whole range to short-term tenancies over specific areas could allow farmers to drain or fertilise more of the range.

Conditions will need to be included in the tenancies to preclude this activity.
